Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that the reference (Moller) fails to disclose that the protection data is only modifiable so as to increase the protection level. Moller discloses a similar limitation in Para 28. According to Para 33 and 34 of applicant's specification, the access control bit (protection data 0 or 1 with 0 representing an access enable bit and 1 representing an access disable bit) is only modifyable from a 0 to 1 (enable to disable) which effectively increases the protection level (no-access). Para 28 of Moller teaches an access control protection data stored in the first memory block 4 (1 and 0 with 1 representing an access enable state and 0 representing an access disabled state) and according to Moller, the bit are only changeable or modifyable from 1 to 0 (enable to disable, access to no-access) which increases the protection level and not the other way around. so access to the protected data can only be changed from enabled to disabled but not from disabled to enabled.
